

This region's forests will be affected by a changing climate and other stressors during this century. A team of managers and researchers created an assessment that describes the vulnerability of forests in the region (*Handler et al. 2014*). This report includes information on observed and future climate trends, and also summarizes key vulnerabilities for forested natural communities. The Landscape Change Research Group recently updated the Climate Change Tree Atlas, and this handout summarizes that information.

Full Tree Atlas results are available online at <u>www.fs.fed.us/nrs/atlas/</u>. Two climate scenarios are presented to "bracket" a range of possible futures. These future climate projections (2070 to 2099) provide information about how individual tree species may respond to a changing climate. Results for "low" and "high" emissions scenarios can be compared on the reverse side of this handout.

The updated Tree Atlas presents additional information helpful to interpret tree species changes:

- Suitable habitat calculated based on 39 variables that explain where optimum conditions exist for a species, including soils, landforms, and climate variables.
- Adaptability based on life-history traits that might increase or decrease tolerance of expected changes, such as the ability to withstand different forms of disturbance.
- Capability a rating of the species' ability to cope or persist with climate change in this region based on suitable habitat change (statistical modeling), adaptability (literature review and expert opinion), and abundance (FIA data). The capability rating is modified by abundance information; ratings are downgraded for rare species and upgraded for abundant species.
- Migration Potential Model when combined with habitat suitability, an estimate of a species' colonization likelihood for new habitats. This rating can be helpful for assisted migration or focused management (see the table section: "New Habitat with Migration Potential").

Remember that models are just tools, and they're not perfect. Model projections can't account for all factors that influence future species success. If a species is rare or confined to a small area, model results may be less reliable. These factors, and others, could cause a particular species to perform better or worse than a model projects. Human choices will also continue to influence forest distribution, especially for tree species that are projected to increase. Planting programs may assist the movement of future-adapted species, but this will depend on management decisions. Despite these limits, models provide useful information about future expectations. It's perhaps best to think of these projections as indicators of possibility and potential change.

SOURCE: This handout summarizes the full model results for the North Central Glaciated Plains (Ecological Section 251B), available at <u>www.fs.fed.us/nrs/atlas/combined/resources/</u> <u>summaries</u>. More information on vulnerability and adaptation in the region can be found at <u>www.forestadaptation.org/northwoods</u>. A full description of the models and variables are provided in Iverson et al. 2019 (<u>www.nrs.fs.fed.us/pubs/57857</u> and <u>www.nrs.fs.fed.us/</u> <u>pubs/59105</u>) and Peters et al. 2019 (<u>www.nrs.fs.fed.us/pubs/58353</u>).

CLIMATE CHANGE CAPABILITY

CEIMATE CHANGE CAT	ADIETT						
POOR CAPABILITY							
American basswood	Ohio buckeye						
American hornbeam	Paper birch						
Bigtooth aspen	Quaking aspen						
Black ash	Red mulberry						
Black cherry	Red pine						
Black maple	Serviceberry						
Black oak	Shagbark hickory						
Black walnut	Slippery elm						
Black willow	Sugar maple						
Chinkapin oak	Tamarack (native)						
Eastern cottonwood	White ash						
Eastern redcedar	White oak						
Eastern white pine	White spruce						
Green ash	Yellow birch						
Northern red oak							
FAIR CAPABILITY							
American elm	Ironwood						
Bitternut hickory	Northern pin oak						
Boxelder	Red maple						
Honeylocust							
GOOD CAPABILITY							
Bur oak	Hackberry						
MIXED RESULTS							
Black locust	Sycamore						
Silver maple							
NEW HABITAT WITH M	IGRATION POTENTIAL						
Ashe juniper	Pecan						
Black hickory	Post oak						
Eastern redbud	Shingle oak						
Osage-orange	Sugarberry

ADAPTABILITY: Life-history factors, such as the ability to respond favorably to disturbance, that are not included in the Tree Atlas model and may make a species more or less able to adapt to future stressors.

- + HIGH Species may perform better than modeled
- MEDIUM
- LOW Species may perform worse than modeled

HABITAT CHANGE: Projected change in suitable habitat between current and potential future conditions.

- INCREASE Projected increase of >20% by 2100
- ▼ DECREASE Projected decrease of >20% by 2100
- change of <20% by 2100
 NEW HABITAT Tree Atlas

NO CHANGE Projected

projects new habitat for species not currently present **ABUNDANCE:** Based on Forest Inventory Analysis (FIA) summed Importance Value data, calibrated to a standard geographic area.

- + ABUNDANT
- COMMON
- RARE

CAPABILITY: An overall rating that describes a species' ability to cope or persist with climate change based on suitable habitat change class (statistical modeling), adaptability (literature review and expert opinion), and abundance within this region.

- △ GOOD Increasing suitable habitat, medium or high adaptability, and common or abundant
- FAIR Mixed combinations, such as a rare species with increasing suitable habitat and medium adaptability.
- ▼ POOR Decreasing suitable habitat, medium or low adaptability, and uncommon or rare
